

SaCarta

The AI operating system for restaurant menus

TECHNICAL WHITEPAPER · 2026

A menu that eats the restaurant's time

Restaurant owners lose hours every single week just keeping their menu alive, and the result is still a static, never-translated, invisible PDF.

6+ h

PER WEEK LOST TO
MANUAL UPDATES

0

TRANSLATIONS ON A
TYPICAL MENU

0

VISIBILITY INTO WHAT
GUESTS LOOK AT

Every time a plate changes, a price moves, or a season ends, someone edits the menu by hand, dish by dish, category by category. The printed PDF goes stale the moment it is printed. International guests cannot read the menu, so they order less, or not at all. And the owner has no data about what actually sells, so the menu never improves: it just exists.

SaCarta was built for the hospitality industry of Mallorca: restaurants, hotels, bars, beach clubs and coffee shops, where multilingual guests are the norm and the menu is the first sales pitch a business makes.

- **Hours lost:** rewriting dishes, prices and descriptions on every change.
- **Never translated:** international guests cannot read the menu, so they order less.
- **Zero visibility:** no data on what guests look at means the menu never improves.

An AI employee that runs the menu for you

Upload your menu once. SaCarta structures it, writes appetizing descriptions, translates it into your guests' languages, and keeps it optimized, all behind a QR code your customers scan at the table.

Upload

Import from a PDF or pasted text. AI builds the full structure: categories, dishes, prices, dietary flags.

Build

Descriptions generated in the restaurant's voice, with style presets from luxury to casual.

Translate

Every dish translated into every supported language with culinary sensitivity, not word-for-word.

Optimize

A 0-100 health score and daily recommendations tell you exactly what to improve.

StartersMainsDessertsDrinks

Starters

Tomato bread with Iberian ham

€7.15

 Toasted country bread, grated ripe tomato, extra virgin olive oil and Iberian ham.

Mallorcan salad

€9.79

Lettuce, tomato, onion, olives and tuna with homemade mayonnaise.

Homemade stew croquettes

€8.25

Creamy stew croquettes with homemade béchamel.

One shared AI layer, seven agents, zero drift

Every AI capability lives in a single shared TypeScript package consumed by the browser and the backend alike. Nothing is bolted on per feature.

AI AGENTS

7

ZOD SCHEMAS AT THE
BOUNDARY

8

FEATURES SHIPPED &
VERIFIED LIVE

Agents

- **Description, Translation, Optimizer:** single-purpose, deterministic pipelines where business rules meet the LLM.
- **Import:** PDF or text to a fully editable menu tree in minutes, chunked and schema-repaired.
- **Copilot:** a chat that can mutate the menu through a mandatory preview-and-confirm gate.
- **Insights & Recommendations:** a consultant-style read of the analytics, with dismissible action cards.
- **Customer Assistant:** a safety-critical chat on the public menu with hard constraints enforced in code.

Why it is trustworthy

Every input and output crosses a Zod-validated boundary, so invalid data never reaches the UI. Every generation is audited: jobs, credit consumption and menu scores are persisted. The Copilot can only write through a deterministic resolver and executor after the owner confirms a preview. And the LLM gateway uses key rotation with a free-to-paid fallback chain for zero-downtime generation.

Frontend, backend, and a shared AI package

A Vite/React SPA talks to Supabase (Postgres + RLS, Auth, Storage, and 14 Deno Edge Functions) and to Vercel serverless for long-running imports. Both consume the same AI package.

Key decisions

- **Shared AI package:** packages/ai is consumed by the browser and by every Edge Function: one schema, one provider gateway, one behavior.
- **Row-level security everywhere:** 21 tables, RLS enabled, with a service-role boundary for server-side writes.
- **Client-driven imports:** long AI imports run as short serverless steps driven by the client, avoiding platform time limits entirely.
- **Stripe webhooks:** entitlement sync is event-driven and idempotent, not client-pollled.

From sign-up to a translated, living menu

Onboarding takes two paths: build the menu by hand, or upload it and let the AI assemble everything.

- **1 Sign up:** create the restaurant, pick a path: manual or AI-assisted setup.
- **2 Build:** editor or AI import; every suggestion stays editable.
- **3 Translate:** one tap per language, per dish or for the whole menu.
- **4 Publish:** a QR code guests scan at the table; schedule menus by service time.
- **5 Optimize:** a health score, insights, and an AI copilot that acts on your words.

Modern, boring, production-grade

A deliberately mainstream stack: every layer is a widely-known technology with a real community.

Frontend

React 18 + TypeScript, Vite, Tailwind CSS and shadcn/ui. i18n in en / es / ca.

Database

Supabase Postgres: 21 tables, RLS enabled everywhere, Auth, Storage.

Backend

14 Deno Edge Functions + Vercel serverless for long-running AI imports.

AI

packages/ai: agents, pipelines, Zod schemas, providers. Gateway: OpenCode Zen with key rotation + fallback.

Billing

Stripe subscriptions with a customer portal; webhook-driven entitlement.

Email

Resend transactional email (welcome, contact).

Verification

Each of the 8 AI features was exercised end-to-end against the live project with a real LLM call before being considered done, including safety tests for the Customer Assistant (allergen exclusion, budget filtering) and the Copilot (price change previewed, confirmed, applied, and audited).

Subscription SaaS, priced for a restaurant

Three plans that pay for themselves: the AI import alone replaces hours of manual work every month.

Sargantana · Free

1 menu, 1 language, 25 dishes, basic QR.
Enough to try the product; the AI import is the upgrade hook.

Ferreret · 8.99€/mo

3 menus, 2 languages, 50 dishes, schedules, advanced analytics. Monthly or annual.

Myotragus · 139.99€

Lifetime access, unlimited languages, 1000 dishes, VIP support, manual setup by the team.

AI credits

Each plan includes a monthly AI credit allowance metered per generation (description, translation, import, copilot turn, insights).

Why it is defensible

- **Time is the price anchor:** the hours a menu costs per week dwarf a monthly subscription.
- **High-leverage upgrade:** AI Import is the single biggest reason a free owner converts.
- **Audited usage:** every AI call is metered and persisted, so credit limits and costs are precise.
- **Entitlement that stays honest:** Stripe webhooks keep the plan in sync automatically.

From menu management to an AI employee

SaCarta's direction is simple: the owner should almost never create a menu item by hand again.

They provide raw material: a PDF, a photo of a printed menu, a stack of notes. SaCarta does the work a junior hire would otherwise be paid for: extracting structure, writing appetizing copy, translating with culinary sensitivity, and continuously telling the owner how to make the menu better.

What the future adds

- **Deeper insights:** narrative reads of the analytics with concrete, dismissible recommendations.
- **A more capable copilot:** richer natural-language operations, always behind the preview-and-confirm gate.
- **A smarter customer assistant:** more nuance within hard, code-enforced safety constraints.

A deliberate exclusion

SaCarta will not generate AI food photography. A photo on a real menu is a promise about what the diner will be served; a synthetic image risks deceiving them the moment the real dish arrives. Real owner-provided photos stay, untouched.
